Thanks to my amazing teammates, @linchenyu @mianwang1024 @zhengnie233 @dlondmike
Shout out to @linchenyu for amazing solution

First we tried Gemma2 9b with AutoModelForSequenceClassification using truncating from the beginning and weight ensemble with LGBM got private lb 0.685

Second solution, we use qwen2.5 14b model with AutomodelForCausalLM using mid cut truncating and instruction tuning got a better performance ,private lb 0.712627

Instruction Tuning is better than the classification model because it gets better reasonability

We did not tried distillation and cot data for training just simple instruction tuning with external data and VLL inference

Dataset we used: lmsys, current comp data and dpo 40k
Tokenization method: mid cut with prompt + response_a + response_b + winner
Model: Qwen2.5 14b with AutoModelForCausalLM

We got the reference from this solution: https://www.kaggle.com/competitions/eedi-mining-misconceptions-in-mathematics/discussion/551688
